

**Hawkins.** 1625.

An Almanacke, and  
Prognostication, for the  
yeare of our Lord God. 1625.  
being from the creation, 5587.

*Being the first after the Bissextile  
or Leape-yeare.*

Calculated for the Meridian  
and Latitude of Cirencester in  
Gloucester-shire, being in latitude 52. d  
8. and in longitude 21. d. 56. Serving  
very precisely for all the South  
parts of England, and generally for  
all England, without sensible  
error.

Made and written by *George  
Hawkins*, Seruant to the Right  
Worshipfull, Sir *Neuill Poolle* of  
*Woxley*, in the County of  
*Wiltis*, Knight.

LONDON:  
Printed for the Company of  
Stationers.

Common Notes for this present year, 1625.

The Golden number.	11.
The Epact.	1.

# January hath xxxj. dayes.

So Boreas breathes from forth the frozen Zone,  
 That Riuer turne to Christall Rockes, like stone :  
 The bald-pare woods are per'wigd with the wooll  
 That Nature from congealed clouds doth pull.

## Of The foure Quarters of the yeere : and first of Winter

**T**he Hiemall or Winter quarter beginneth the  
11 of December 1624, at 9. of the clocke 51 mi-  
nutes, 29 seconds in the after noone, at which time  
the Sun entreteth into the first Scruple of Capri-  
corne, continuing untill the Noble Sun haue past  
thzough the Tropicall signe Capricorne, and in the  
like manner thzough Aquaries and Pisces, which will  
be the 11 day of March 1625.

Above the Horizon the Sunne scarce peepes,  
But presen'ly in th' Ocean he steepes;  
His fiery steeds Thetis so long detaines him,  
Aurora ielous growes ere that she gaines him;  
Through his long absence the wet Element  
Congeales to ice, the Clouds which raine down send  
Drops flakes like wooll, so that vnto our sight  
Brookes, woods and Fields, are all died perfect white;  
Come gentle Spring, and let thy power be seene.  
And blot out white, and write it all in greene  
And Titan mount, Let not dim Phoebe shine,  
Longer then thou, Lord of th' Eclipticke line.

## A Prognostication.

### Of the Spring.

**T**he pleasant season of Spring, whose returne  
reuiues each vegitable, and hath his beginning  
the 11 Day of March, at 1 of the clocke, and 6 minutes  
57 seconds in the morning, so then the resurgent  
Sunne hath mounted from the winter Solstice to  
the Equinoctiall line of the first scruple of Aries, at  
which time the day and night are of equall length:  
This quarter continueth vntill the 11 of Iune, at which  
time the Sunne entreteth the Summer Solstice, ha-  
ving runne through these signes, Aries, Taurus, & Ge-  
mini.

Apollon now rides equally betweene  
The worlds two poles, and is as long time seen  
Within our hemispheare, ere that he leaue vs,  
As in the other halfe world which is beneath vs:  
And mounting higher doth againe reuiue  
Things sensible as well as vegatiue,  
Man cheerefully trips ore th' Enameld fields,  
Which many sweet delights vnto him yeelds:  
There growes all flowers to the eye or feat  
The which (almost) might giue the soule content:  
Sweet harmony to please the dainty eare,  
Mellodious Birds are chanting euery where;  
So shrill proceeds the musicke from their throats,  
Rocks ring the Echoes of their wel-tuned notes.

Hawkins 1625.

## Of Summer.

**S**ummer hath his beginning when as that tranſ-  
parent Lampe of light the Sonne hath almost  
mounted to our Zeneth, entring the first minute of  
the Tropicall signe Cancer, which is the Equall  
Solstice, and is then in his greatest declination to-  
wards the North from the Equinoctial, being then  
with vs the longest day and shortest night in the  
yeer, and is the 11 of Iune at 8 of the clocke, 46 mi-  
nutes and 46 seconds after noone This quarter con-  
tinueth until Phoebus haue in his Majesty rid  
thzogh these summer signes, Cancer, Leo and Virgo,  
ending when Tisan hath entred the first degree of  
Libra.

What hedious noise ring in the Firmament?  
See with what violence the clouds are rent;  
What thing oppresseth nature thus, I wonder,  
That heauens cracke, as they would split a sunder,  
The clouds dissolue in teares to heare the sound,  
The fire runs flashing all along the ground,  
The worlds six Center shake, and man doe feare,  
Lest all to nothing turne, as first they were;  
But see, al's hush; with milde aspect the skie  
Vnmasks her Cloudy front immediatly,  
And comforts vs, that were but now halfe dead,  
And thought the graue would next haue been our bed.

## A Prognostication.

### Of Autumne or Haruest.

**H**aruest being the last quarter of the yeere, hath his beginning the 13 day of September, at 10 of the clocke, 28 minutes, 55 seconds in the morning, for then the magnificent Chariter Apollo enters the first scruple of Libza, making the day and night againe of equall length, producing the second Equinoctiall: This quarter endureth until the day-guide Phcebus haue past Libza, Scorpio and Sagittarius, which will be the 12 of December.

No subcelestiall things haue permanence,  
All things decay, compos'd of Elements:  
How curiously of late was Tellus Crest,  
With various colours by sweet Flora drest:  
As Roses, Lillies, Gilliflowers, and Daisies,  
With Honisuckles, and with yellow Craises,  
With millions more which I cannot repeate,  
Such as by no meanes Art can counterfeit.  
But all those dresses wrought by Natures hand,  
Are now cut off, and may no longer stand;  
The ample fields are of their graine bereft,  
On Trees no fruit nor leaues at all are left:  
Meadowes are rob'd of what delights them most,  
Narcissus soule and Hiacinthus ghost,  
The Earth doth grieve because she must intombe  
The seed shee bare againe within her wombe.

## Eclips.

**T**here will be but one Eclipse this yeer, which is of the Moone, it will be on the 13 day of March at midnight: Suppose the Moone be divided into 12 parts or digets, two of these parts or digets and one quarter, will be Eclipsed, it will dure 1 houre 47 minutes.

## The Course of the planets this yeere.

**S**aturne is retrograde from the 2 day of December 1624 vntill the 18 day of April 1625, and then is direct vntill the 14 of December.

**I**upiter from the 4 of Ianuary vntill the 9 day of May is retrograde, and then is direct all the yeere after.

**M**ars is direct from the beginning of the yeere vntill the 4 of August, then retrograde til the 6 of October, from thence direct to the yeeres end.

**V**enus is direct from the beginning of the yeere vntill the 12 day of Iune; then retrograde til the 26 of August, and then direct to the end of the yeere.

**M**ercury is direct till the 11 of February, then retrograde vntill the 5 of March, then direct vntill the 8 of Iune, then retrograde till the first of Iuly; then direct to the 1 of October, and then retrograde all the yeere.

## A Prognostication.

**A way to finde how long  
the Moone shineth, when shee ri-  
seth and setteth, her comming to the  
South: Likewise to know what it is  
a Clocke by hir shadow on a Sun  
Diall, and full Sea through  
England.**

**W**hen the Moone increaseth, multiply her age by 40  
all her decrease subtract her age from 30, the re-  
mainder multiply also by foure, the product diuide by 5,  
the quotient sheweth the number of houres shee shineth  
after Sun-set, or before his rising: the remainder of the  
diuision multiply by 12, to haue you the minutes to be  
added. Note that all the increase, the Moone follow-  
eth the Sun, & commeth to the South after noon: & af-  
ter the full, she goeth before the Sun, and commeth to the  
South in the morning.

### Example.

**T**he 5 day of February the Moone is 10 daies old, which  
as is said, being multiplied by 4, the product is 40,  
which 40 being diuided by 5, the quotient will be 8, then  
I conclude the Moone shineth 8 houres after sun-set: then  
looke I on the 5 day of February, and in the first Colloom  
towards the right hand answering to the 5 day, I finde  
7 and 8 the hour of Sunne rising, for that day: to know  
his setting, no more but see what it wanteth of 12 a clock,  
which you shal find to be, houres 52 minutes, then I say,  
the Sun setteth at 4 & 52 minutes (note that 60 minutes  
are an houre) to the which 4 and 52 minutes, I adde the 8  
houres (which before I found the Moone did that day  
shine

## Hawkins 1625.

time after sun set) which maketh 12 houres and 52 minutes, so then haue you the houre of the Moons setting, which is at midnight, or 12 a clocke at night and 52 minutes after: now for his rising, and comming south, adde likewise the quantity of her shining (which is 8) to sun rising, which as is said before, is 7 houres and 8 minutes, which maketh 25 houres & 8 minutes, from which deduct 12, so I say the Moone riseth at 3 & 8 minutes after noone, commeth to South at 7 a clock & 45 minutes, & from rising to setting she shineth 9 houres 44 minutes.

Now for full Sea through England, finde the Moones comming south, as is raught before, the which in the example for her shining and comming south, you finde her south at 7 a clocke and 45 minutes, then is it full sea at South-hampton, Dubbozow, and Portsmouth, for whensoever, or at what houre soeuer you finde the Moone to come South, it is full Sea at these 3 forenamed places. The to know full Sea at London adde to her comming South 3 houres, so haue you your desire, for Graues-end, adde one houre & a half, for Bristow adde 6 houres 45 minutes, for Barwick & Ostend, adde 3 houres 45 minutes, for Redban and Aberden, adde 45 minutes, for Dundee, Saint Andrewes, Billy, 2 houres 15 minutes, for Fifth. Leith, Dunbar, 4 houres 30 minutes, for For. Lyn, Humbar, Weymouth, Dartmouth, & Plimouth, 6 houres for Whitford and Bridgewater 7 houres 30 minutes, for Orkenpool, Orwel, 8 houres, for Diep. Lur, Kenoy, 9 houres 45 minutes, for Bollien, Douer, Harwich, Dartmouth 10 houres 30 minutes, for Callice, Rye, and Winchelsey 11 houres 15 minutes.

Note this rule is not alwaies perfectly true, yet it is neere the truth, and sometimes most exact.

Now for the houre of the night, when you know the houre of her comming to the south, looke on a Sun diall, and see what houre the shadow of the Moone giueth, for full so much as it wanteth of 12 a clocke, so much deduct from the houre of her comming south, if it be in the increase so haue you the houre you sought for, but if after the full, then adde what it wanteth of 12, and you haue your desire. Note if the Moone be past the full, and her shadow on the diall be past noone, yet must you adde so much

## A Prognostication.

much as it is past noone to his comming South, you are likewise to adde the time the is past noon to her comming South, if they be in the increase, and you haue done.

Because all men haue not the Art of Arithmetick, whereby to find the Moons comming to the South, I haue here set downe a Table to direct them:  
the vse is as followeth.

The moones comming to the South.	The age.	The D
12	48	1
11	36	2
10	24	3
9	12	4
8	0	5
7	48	6
6	36	7
5	24	8
4	12	9
3	0	10
2	48	11
1	36	12
	24	13
	12	14
	0	15
		03

When you know the age of the Moon, seek in this Table for it: As suppose she is 11 daies old, seeke in the colum next your right hand, for the number 11, then in the same line towards the left hand vnder the title the Moons coming to the south, you shall see 8 and 48 minutes: so I conclude the Moon is South at 8 a clocke and 48 minutes, and so consequently full Sea at South-hampton, Quinborough, and Portsmouth, and according as is shewed before, by adding the howeres and minutes as you are taught, you haue high water at all our English hauens.

Of

# Of the weights & measures commonly vsed in England, and from whence they are deriued.

**T**here are vsed in England, two kinde of weights,  
the one Troy, the other Auerdepois; the first by  
Law, the latter by custome; but they are for seuerall  
sorts of wares and commodities.

By Troy weight is weighed Gold, Silver,  
Pearles, Precious stones, Bread, Wheate, and  
such like, and from it is deriued the measures of  
graine.

Now the least portion of weight, is a graine of  
Cerne of Barly, taken out of the middest of the eare,  
and by 24 of these graines make one penny weight,  
(I mean not a penny weight of our Silver) but  
Gold-Smiths weight, which is 3 pence of our silver.  
20 penny weight } make one { ounce } Troy.  
12 ounces } pound }

Auerdepois is by custome, and thereby are weighed  
all kinde of Grocers wares, Physicall drugs, But-  
ter, Cheese, Flaxe, Ware, Pitch, Tarre, Tallow,  
woolles, Hempe, flesh, Iron, Steele, Lead, and  
diuers other Commodities; but especialy every thing  
whereof issueth a refuse or wast, and this hath 16  
ounces to the pound, every ounce having 20 penny  
weight, every penny weight having 24 graines and  
 $\frac{2}{3}$  of a graine.

So 1 pound Auerdepois } hath 7008 } grains.  
that 1 pound Troy } in it } 5760 }

¶

Likewise

## A Prognostication.

Likewise 14 ounces, one halfe and two penny weight Troy, do make 16 ounces Auerdepois.

Having briefly shewed you the derivation of weights by which all measures both of graine and Liquor is made, I now proceed to speake of those measures which are made by Troy weight.

Note that a pound weight is a pinte  
in measure, as is said  
before.

24 grains	} make one	penny weight Troy.
20 penny weight		ounce.
12 ounces		pounds or pinte,
2 pounds or pintes		quart.
2 quarts		pottle.
2 pottles		gallon.
2 gallons		pecke.
4 pecks		busshell.
4 busshells		corbe or carnoch.
2 corbes or cornocks		quarter.
6 quarters		weigh.
10 quarters		last.

Here followeth the measures of  
Liquor.

2 pintes	} make the gallon.	
4 quarts		
2 pottles		
Of Ale	} the Firkin the Kilderkin the Barrel the Hoghead	} contai. meth
		8
		16
		32
		64
		Gallons.
		512 pintes

# Hawkins. 1625.

512 pintes	}	maketh the	Hoghead of quarter.
256 quartes			
64 gallons			
8 firkins			
4 kilderkins			
2 barrells			
8 bushells			

So then the	Pintes and pound	}	are of like con- tents.
	Firkin and bushell		
	Barrell & Combe		
	Hoghead & quarter		

Yet there remaines an other kinde of measure where-  
by is measured length, breadth, and thickeesse, which in  
like manner is deriued from cornes of Barley taken one  
of the middes of the Eare as they are for weight, which  
being laid endlong together,

3 Grains of barley in length	}	make one	inch.
9 Inches			quarter of a yard.
12 Inches			foot.
3 foote			yard.
5 quarters of an yard			elle.
5 yards and one halfe			pearch.
40 pearches in length			furlong.
8 furlongs			mile.

So that an English mile grounded on the Statute, is in length	}	320 perches.
		1760 yards.
		5280 inches.
		190080 barley-corn lengths.

Lands and Woods are measured by the pearch, which  
is as is said before 5 yards and one halfe, or 16 foote and  
one halfe square; 160 of these square perches make one  
Acre by Statute, howbeit in some places they sell their  
Cops woods at 24 fete to the pearch: other where 22  
same other (and most common) by 18 foote to the pearch  
or pole, which custome haue brought to passe.

Wall is measured by 18 foote to the perch, but when a  
pearch of wall is but one foot high, and 18 foot in length.  
Glass, boordes and Timber, are measured by the foote  
E 2 square;

## A Prognostication.

square, so that a foote of Glasse or wood, haue in it 144 square inches, but one foot of Timber (because it is solid) is a Cube) containeth 1728 cubecall inches.

## How to finde the Golden number for euer, and what it is.

First seeke the yeere of our Lord in which you would know the Golden number of Prime (which at both one having found it, adde to it one, & diuide it by 19, the quotient select as of no vse, but only to know how often the Moone haue made all her variations, but see what remaineth, for the remainder, is the Golden number.

As for Example.

This yeere 1635 I would know what is the Golden number: then to 1625 I ad 1, so haue I 1626, which I diuide by 19, the quotient I finde to be 85: then I say the Moone haue 85 times made all her variations, the remainder I see is 11: so then I conclude the Golden number for the yeere 1635 is 11. Note if there remaineth nothing, the Golden number is 19, as it will happen in the yeere of our Lord 1633.

The Golden number of Prime neuer exceedeth 19, for in 19 yeeres, as it was supposed (when this number was first inuented) the Moone should make all her variations, and then to begin againe just as before: so that the 20 yeere the Moone must haue her changes, aspects, and such and the same Eclipses as the first, which is faulfe: howbeit at the inuention it was thought most exact, and for the rarnes of it, it was writen in letters of gold, from whence we call it the Golden number.

The Epact is the number of 11 daies, which the Solace yeere receiue the Lunar yeere, and by adding 11 to the Epact that was the last yeere, you haue it for this yeere: As for example.

The last yeere 1624 the Epact was 20, to the which ad 11, that maketh 31, from which subtract 30, there remaineth one, which is the Epact for 1625. Note that the Epact

## Hawkins. 1625.

pact neuer exceedeth the number of 30, for if by the adding of 11, the number amounteth to more then 30, take away 30, the remainder is the Epact.

Another way to finde the Epact.

Multiply the Golden number by 11, and divide the product by 30, the remainder is the number sought for.

A ready way to finde the age of the  
Moone any day in the yeere.

**T**ake the Epact, ad to it the day of the moneth in which you desire to know the Moones age, likewise take the number of the moneths from March, accounting March for one, & adde it all together, then if the number exceed 30, cast away 30, the remainder is the age of the Moone: if iust 30, then that day the Moone changeth: if vnder 30, then conclude, that is the age sought for.

As for example.

I would know the age of the Moone the 5 day of August this present yeare: to the day of the moneth which is 5, I adde the Epact which is 1, so that maketh 6, the 1 I take the number of moneths from March (it being one of the number) which are 6, so adding the dates of the moneth being 5 the Epact being 7, and the number of the moneths from March which are 6 together, the totall is 12: so then I conclude the Moone is 12 dayes old the 5 of August. And thus may you know the age of the Moone any other day in the yeere.

But more properly the Sunday Circle.

**T**he Circle of the Sun neuer exceedeth 28, for in 28 yeeres the Dominicall letters make al their changes and variations, and then beginneth againe, and such and the same is the Dominicall letter this yeere as it was 28 yeeres: thence this number increaseth one every yeere, vntill 28 yeeres is complet, and then it beginneth at one againe, and so proceedeth vnto the foresaid number of 28.

A Table

A Table of the names and valuation of the common Gold  
 Coines of England, with their severall weight of peece and  
 graines, what they are worth of currant English money,  
 and what they ought to weigh of our money, as now it is  
 valued.

The Names and titles of the Gold.	The weight.		The Value.		The weight of these Coines if you weigh them by our silver money now currant in England.
